

Implement Our Workflow-Driven Platform
and See a Full Spectrum of Benefits.

M*Modal **Fluency for Imaging**[™]

m*modal[™]

M*Modal Fluency for Imaging™

- Improves quality, productivity and efficiency
- Accelerates report turnaround time
- Promotes informed decision-making
- Orchestrates workflow for optimized experience

A comprehensive radiology reporting solution that unites three critical radiology applications: intelligent Speech Understanding™ with structured reporting, a consolidated vendor-neutral worklist, and business intelligence and analytics.

Radiology Reporting— Redefined

Good reporting is simply not enough in today's fast-paced, quality-driven healthcare environment. In an era where electronic health records are the norm and data is king, inconclusive and delayed radiological findings cannot be tolerated. The detriment to diagnosis, treatment and patient safety is too extreme. Even a single hour delay is critical. M*Modal's Fluency for Imaging accelerates radiology reporting while improving productivity and distribution of stronger, more accurate findings. Radiologists create reports by doing what comes naturally, speaking. Physician dictation is transformed into electronic documents that are structured, clinically encoded, searchable and shareable.

- Comprehensive documentation and workflow management platform
- Intelligent Speech Understanding technology
- Structured reporting and integrated productivity tools

Company Facts

- A rich portfolio of patents and licenses in speech recognition and understanding
- 200,000 physician users
- 3,850 hospitals, clinics and practices
- 12,000+ employees worldwide

Product Facts:

- Advanced Speech Understanding technology
- Structured reporting
- Integrated productivity tools
- Consolidated worklist
- Multi-location and multi-vendor
- Business Intelligence and Analytics (BIA)

Become the Picture of Productivity with Our Workflow-Driven Platform for Imaging.

Imaging Worklist — Consolidated

Multiple sites, multiple specialties, multiple RIS, EHR and PACS. This is the environment radiologists face today. M*Modal Fluency for Imaging™ simplifies and unifies the imaging worklist. Every exam, regardless of location or vendor, is brought into a single, Web-based view.

Advanced exam filtering and prioritization, as well as workload distribution and exam assignment capabilities based on customized business rules, facilitate the delivery of high-quality, sub-specialty interpretations.

Important clinical content, such as lab values and pathology reports, is available within the radiology workflow — at just the right time.

The result? Measurable improvements in productivity, turnaround time, cost-effectiveness, quality and patient outcomes.

- Work automatically distributed and prioritized based on system and specialty filters
- Business intelligence drives exams to the right specialty reading room
- Radiologists rapidly move through the interpretation process

Clinical Content — Delivered

The job of radiologists is to make a diagnosis as quickly and accurately as possible. But without access to patient-specific clinical data, they work in a vacuum. M*Modal Fluency for Imaging eliminates the barriers to high-quality, accurate radiological interpretations.

Access to the longitudinal patient summary through an integration with M*Modal Catalyst for Radiology™ provides context-specific clinical information at the time of report creation. Real-time physician feedback prevents and addresses documentation deficiencies before reports are signed and finalized. Critical Test Result Management (CTRM) and Peer Review solutions offer additional productivity-enhancing workflow extensions. Integrations with third-party solutions deliver dose and contrast monitoring, as well as critical communications escalation capabilities, to complete the picture.

- Improves patient outcomes through better clinical communication and collaboration
- Gives radiologists all the patient-specific information they need at time of interpretation
- Delivers more accurate and clinically correlated radiology findings

Business Intelligence — Analyzed

You can't improve processes until you measure and analyze them. That's where M*Modal Fluency for Imaging comes in. Our Business Intelligence and Analytics (BIA) capabilities deliver both tactical and strategic tools needed for informed decision-making to better manage the practice of imaging. With radiology reimbursements dropping, you need every advantage to improve efficiency and productivity. Powerful capabilities give radiologists and administrators real-time answers to planned and ad hoc questions, as well as make workflows smarter and more efficient.

- Have tactical and strategic awareness
- Monitor and improve defined organizational performance
- Distribute work and manage exams more effectively

M*Modal Collaboration Drives Patient Care

Every day radiologists recommend follow-up procedures, treatments and exams that get lost in phone calls and faxes. Disjointed communication leads to patient safety issues, delayed treatments and higher healthcare costs.

M*Modal Fluency for Imaging promotes follow-up care and protects patient safety by enhancing and automating clinical communication.

Interpretations, reports and recommendations are expeditiously forwarded to primary physicians. Findings are communicated and action is taken.

The end result: risks are reduced, patient safety is improved and healthcare dollars are saved.

Unique Features and Benefits

Features

- Structured reporting
- Intelligent Speech Understanding
- Pre-signature physician feedback
- Consolidated, enterprise worklist
- Patient problem summary
- System and specialty filters
- Customized, intelligent workflows
- Robust third-party integrations
- Automated communication
- Clinical data at time of interpretation
- Smart business analytics

Benefits

- Provides a better speech alternative
- Compiles exams across all locations, modalities
- Reduces delays due to incomplete information
- Prioritizes work, saves time
- Optimizes user experience
- Improves patient safety, compliance and outcomes
- Eliminates inconclusive findings
- Delivers context-specific patient information for strong decision-making
